Huang Xuhua, a great Chinese scientist, passed away on February 6th, 2025. But his great deeds and strong spirit will always stay in our hearts and keep lighting up China’s way forward.

Huang Xuhua was born in Guangdong Province in 1926. When he was young, he saw the hard times of his country under foreign attacks (侵略). These sad memories made him study hard. He made a promise to make the country strong with his knowledge.

In the 1950s, when China started to develop nuclear submarines (核潜艇), it was a very difficult job. Huang Xuhua was not afraid and stood up bravely. At that time, there was not much advanced technology

or many resources. It was like climbing a very steep mountain. But he and his team took on this challenge. To keep the project secret, they stopped contacting (联系) the outside world, even their families. Huang Xuhua left his hometown for many years.

During the design process, they met a lot of problems. For example, designing a nuclear reactor (核反应堆) was really hard. They couldn't get help from foreign experts, so they could only depend on their own research. They used simple tools like abacuses and slide rules (算盘和滑尺) to calculate and do experiments with great effort. Another important problem was to make sure the submarine was stable underwater. After many simulations and tests, they gradually overcame these problems.

Finally, in the 1970s, China's first nuclear submarine was built and tested successfully. This made China one of the few countries that had this ability. Huang Xuhua didn't stop after this big success. He went on to help with the development of submarine technology. His hard work and devotion won him many honors, including the "Medal of the Republic" ("共和国勋章") in 2019.

Now, when we think of him, we know that his life can inspire us a lot. We, especially the young people, should learn from his spirit. Let's take on the responsibility, face challenges bravely, and work hard to make China stronger. In this way, his spirit will live on forever.

##### The Wright brothers and the first plane

In 12 seconds in the year 1903, two young Americans changed the world forever. That was the length of the first successful flight (飞行) of Orville Wright and Wilbur Wright's plane.

Wilbur was born in 1867 and Orville in 1871. The Wright brothers developed a strong interest in flight from early childhood. They taught themselves maths and engineering. They started their flying experiments with big kites and gliders (滑翔机) and finally decided to make their own plane. The two brothers worked very hard to make a small engine and a propeller (螺旋桨) for their plane.

Their first plane weighed 340 kilograms. Its wings were 12 metres wide. On 17 December, 1903, Orville sat in the plane and made the first successful flight at Kitty Hawk, North Carolina. His flight lasted for only 12 seconds and only covered 37 metres, but this was the first time when human beings successfully sent something heavier than the air into the sky with powered flight. Wilbur also flew the plane on the same day. In the last flight of the day, Wilbur flew for 59 seconds and covered a distance of 260 metres.

The Wright brothers improved their plane, and by 1909, it could fly for 32 kilometres. The Wright brothers are surely among the most important inventors of the 20th century.
