Dogs are the most popular pets in the world. They help us stay healthy and make us feel good. However, two Australian researchers worry that pet dogs are making changes on the environment.

From past studies, the researchers found that medicine on dogs’ fur (皮毛) can wash off into water when they swim. The medicine can be harmful to local wildlife, and birds may even use pieces of the harmful fur to make their nests (鸟巢).

Dogs can also pass on illnesses to local wildlife. In Australia, some penguins and special kinds of baby birds have died because of it.

Dogs often run through birds’ seaside nesting areas. When this happens, the birds have to keep flying away. All that flying causes exhaustion. And these birds probably have already used up a lot of

energy (能量) just to reach the beach. As a result, a smaller number of birds are living in the area and there are fewer kinds of birds too.

But the researchers also say the problem isn't really with dogs—it's with how many of them we have and how little their owners care about the environment. According to the researchers, there are between 700 million and 1 billion pet dogs in the world.

Since we will not stop having dogs as pets, we need to find better ways to love our pet dogs as well as to protect the world we share with them.
